## PHYSICS

Take a marble and drop it on the floor from a height of 50 cm . Measure the time taken by the marble to travel that distance using a stop watch available in cell phone. Repeat the experiment by dropping it from $100 \mathrm{~cm}, 150 \mathrm{~cm}, 200 \mathrm{~cm}, 250 \mathrm{~cm}, 300 \mathrm{~cm}$.

Fill the observation table as shown :

| height (cm) | 50 | 100 | 150 | 200 | 250 | 300 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| time (sec) |  |  |  |  |  |  |

Use the data to plot the distance time graph.
Repeat the experiment by using a small thin sheet of laminate (sunmica), record the observation and plot the distance time graph. The sheet should be horizontal when it is released. Answer the questions after analysis of the two graphs.
(i) Is the motion uniform or non-uniform?
(ii) Which of the two has a higher average speed during the whole motion?
(iii) If the average speeds are different, what may be the reason for the difference ?
